

# Moldavite

## The Gemstone that fell to Earth.

Moldavite is one of the rarest minerals on Earth and the total volume of Moldavite in existence is estimated to be only 275 tonnes! Moldavite is an olive-green or dull greenish vitreous substance formed by a meteorite impact. Pieces of Moldavite are found distributed in Tertiary and early Pleistocene deposits in Bohemia and Moravia. For a long time, it was generally believed to be a variety of obsidian, but its difficult fusibility and its chemical composition are rather against its volcanic origin.

It is now generally accepted that Moldavite is the product of a meteor collision with the Earth that occurred 15 to 25 million years ago in the Moldau River valley in the Czech republic. These beautiful green gems have been prized by humans for thousands of years and are still passed on as gifts among royalty. In legend Moldavite is believed to have been the green stone in the Holy Grail and that it has the power to quicken one's spiritual evolution.

It is said that even many people who are insensitive to the energies of gemstones, often feel the energy of Moldavite. This can be manifest as a heat, tingling or pulsing in the hand, or as a 'rush' of energy through the body. Many people believe that Moldavites powerful vibrational energy is a powerful chakra opener, particularly for the hearts and organs above. Sleeping with Moldavite is believed to activate the dream state and wearing it helps to manifest positive life change and spiritual growth.
